Education & Experience

Quantitative Developer / Data Analyst KIS Pricing, Financial Engineering Group

Dec. 2021 – Aug. 2023

- Developed and maintained derivatives pricing modules and managed market data and numerical computation databases.
- Built automated ETL pipeline for KOSPI / HSCEI options market data using Python (Celery, APScheduler), reducing annual data cost by ~£8,268.
- Replaced Excel VBA-based Log-Normal Mixture volatility model with SABR-based Python automation systems, reducing daily validation workflow from 5 hours to 30 minutes (~90% reduction)

Achievement

- 2 Master's Degree** : Master of Engineering(2026) / Master of Science(2021)
- 3 Certifications** : Engineer Information Processing(2024) / ADsP(2024) / SQLD(2024)
- 4 Awards** : IFAC2026 Travel Grant Award(2026) / Academic Award(2020) / Military Commendation(2019) / Military Commendation(2017)

Academic Projects

Project 1 : Imitation Learning Beyond Demonstrator Performance with Certified Contractivity

Feb. 2026 – Jun. 2026

- ✓ Learned imitation policy from a single demonstration with ESO+PID demonstrator on a 4-DOF manipulator, with formal proof and numerical verification of closed-loop contractivity and ISS stability
- ✓ Validated the proposed framework on a 3-DOF manipulator using kinematic information against a PD demonstrator, where a single model trained on 50 repeated demonstrations per trajectory (Ellipse, Lemniscate, Rectangle) conforms generalization to highly nonlinear coupled systems.
- ✓ 91.8% (3-DOF) and 98.4% (4-DOF) tracking RMSE reduction over demonstrator

Project 2 : Enhancing Trajectory Tracking via Neural ODE-Based MPC with One-Shot Learned Error Dynamics

Apr. 2025 – Feb. 2026

- ✓ Single 10-min straight-line dataset with PE excitation generalizes across six distinct trajectories, all surpassing PD demonstrator under uncertain simulation environment.
- ✓ Sim-to-real transfer validated on ROBOTIS TurtleBot3 Burger via LMI-based terminal constraints derived from dissipativity-decreasing inequality
- ✓ Distance RMSE reduced by 70.4% / 72.3% / 75.1% and Heading RMSE by 60.1% / 64.1% / 52.0% across Lemniscate / Perturbed Circle / Perturbed Spiral trajectories.

Project 3 : ARX-ESO-Based MPC and Efficiency Optimization for Industrial Thermal Processes

Nov. 2025 – Dec. 2025

- ✓ Analyzed client-provided PID control logs and operation datasets, designed and implemented ARX(1)+ESO-based MPC tailored to a two-stage industrial heating process, and delivered a technical report with implementation guide.
- ✓ Generalized across 6 independent operating datasets with varying initial conditions(557°C - 685°C) from a single identified model.
- ✓ Average process time reduced by ~47% (490→336 min), total cost reduced by ~51%, heater effort reduced by ~16%, IAE reduced by ~31%, steady-state convergence within ±5°C satisfied across all scenarios.

- Numerical Simulation
- Model design & Training
- API Integration
- Workflow Automation

- Database management
- Schema design
- Data manipulation via SQL

- Data collection & validation in Gazebo & RViz
- Real robot Control & validation
- Design Robot with URDF

- Static web design
- Academic writing
- Structured prompting for LLM workflows
